The commits above indicate the progress of the assignment as the different stages of the project are completed. These stages include reading logical addresses, implementing address translation, handling page faults, implementing FIFO and LRU page replacement algorithms, and testing different frame counts. Although the commits are entirely attributed to Sofia Hall's GitHub account, both team members were involved in designing, writing, testing, and debugging the program as it developed. The team both worked on it together, on the same computer, using Hall's GitHub account, which is why nearly all the commits are attributed to her. The range of commit messages, from initial setup through implementing different algorithms reflects the work completed by the team and is a sign of success.
